

Commercial heating specialist, Potterton Commercial, is extending its range of energy efficient boilers with the launch of the Paramount two - a wall hung condensing boiler available in 30, 40, 60 and 80kW outputs. This is the first time Potterton Commercial has offered a 30kW boiler in its condensing range. This new lower output addition gives the opportunity of installations in light commercial applications, with the 30, 40, and 60kW models being SEDBUK 'A' rated, and therefore suitable for use in larger domestic situations.

Building on the pioneering characteristics of the original Paramount model, which uses the latest technology and delivers exceptional energy efficiency, the Paramount two's superior heat exchanger design using a unique monoblock, modular design, offers optimum heat transfer. It also has an innovative, easy to use 'Integrated System Regulator' (ISR) controls platform.

The Paramount two ISR control system includes inbuilt time control facilities for heating and DHW, servicing and commissioning functions and a parameter reset function. It also has a full text display of parameters and fault diagnostics, input and output testing and simpler programming and end user settings. Looking to the future, the Paramount two also provides a platform for wireless controls.

“For many years the commercial heating sector has not focused sufficient attention on its use of controls but thanks to Part L, this industry wide problem will soon be addressed, benefiting the end user and the environment” says Ken Percival, managing director at Potterton Commercial.

“We have always championed the use of controls to optimise energy efficiency and the Paramount two boiler takes our integrated controls offering to a new level. Our extensive research among specifiers, installers and end-users highlighted the importance of the user interface. Using this feedback we have developed a new and improved control panel making it easy for users to ensure their boiler is running as efficiently as possible.”

The Paramount two is manufactured to the latest production standards and offers a lifetime guarantee on the silicon/aluminium alloy heat exchanger. Weighing from 58kg, with a slim, sleek design - all boilers are only 480mm wide - the Paramount two is an excellent choice where space is at a premium, and offers a comprehensive choice of flue options for single and modular applications. Mounting frames and pipework header kits are also available.
