

POTTERTON COMMERCIAL EXTENDS PARAMOUNT *two* RANGE

Potterton Commercial has extended its Paramount *two* range of wall-hung boilers with the addition of 95 and 115kW models. The two new higher output boilers make the range suitable for an even wider range of commercial applications.

In addition to the new 95 and 115kW capacities, the flexible, lightweight and compact Paramount *two* boilers are available in 30, 40, 60 and 80kW outputs. Being up to 109 per cent efficient, the boilers are compliant with Part L2 of the building regulations and qualify for Energy Technology List status. All Paramount *two* wall hung boilers feature a superior heat exchanger design and offer optimum heat transfer as well as low noise level operation.

The Paramount *two* boilers have a slim, sleek design and at just 480mm wide are probably the most compact in their class. Comprehensive flue options for single and modular applications, mounting frames and pipework header kits are also available. Yan Evans, Potterton Commercial's technical director, said: "As a forward-thinking company, Potterton Commercial is constantly reviewing and reassessing its product offer to meet the changing needs of the market. We have adapted the Paramount *two* so that it is suitable for larger commercial applications – but have made sure that it still offers a compact footprint and low lift-weight."

The Paramount *two*'s control system includes inbuilt time control facilities for heating and domestic hot water, servicing and commissioning functions and a parameter reset function. It also has a full text display for fault diagnosis, input and output testing and simple programming and end user settings. Looking to the future, the Paramount *two* also provides a platform for wireless controls.

Being officially launched at M&E 2007, the Paramount *two* 95 and 115kW models are manufactured to the latest production standards and a lifetime guarantee is available for the silicon/aluminium alloy heat exchanger.

Potterton Commercial's product range spans boiler outputs from 24kW to 3,500kW and includes condensing, wall-hung, pressure jet, modular pre-mix and atmospheric gas boilers, skid-mounted packages, heat recovery units and calorifiers. The company also offers nationwide boiler erection, assembly and commissioning services as well as a lifetime guarantee on all mainstream products.
